Quality Code: brand draft

Oct 21, 2026 · @Mr Viss

What Quality Code is

Quality Code is a Claude Code plugin that turns a Jira ticket into tests you can trust, for any team at TeamSystem. It checks that a ticket is clear enough to test, helps its author fill the gaps, writes Vitest and Playwright tests from the acceptance criteria, and grades them.

The promise behind the brand: the model reads, drafts and writes, but scripts decide every score and verdict. It is for developers and QA on frontend, backend and fullstack projects.

Name

People read **Quality Code**; machines read `quality-code`. The two never swap.

Form	Where it is used	Example
Quality Code	titles, docs, slides, the plugin's display name, running text	"Quality Code checks the ticket first."
`quality-code`	install command, commands, file and folder names, marketplace	`/plugin install quality-code@quality-code`, `/quality-code:start`

Not used: "QC", "Quality-Code", "quality code" in lower case, or the old name "agentic-testing" (it survives only in the GitHub repository name).

Tagline and descriptions

The tagline is **From Jira ticket to tests you can trust.** Every description opens with it or carries its idea.

Length	Text	Used in
Tagline	From Jira ticket to tests you can trust.	wordmark, README, slide titles

Length	Text	Used in
One line	Quality Code checks that a Jira ticket is ready to test, writes the tests from its acceptance criteria, and grades them with scripts, never with the model.	intros, emails, the brand page
Short (listing)	From Jira ticket to tests you can trust: readiness gate, guided fill-in, Vitest and Playwright tests written from the acceptance criteria and graded by scripts, never by the model.	marketplace entry
Long (plugin)	From Jira ticket to tests you can trust. Quality Code checks that a ticket is ready to test, helps its author fill the gaps, writes Vitest and Playwright tests from its acceptance criteria, and grades them with scripts, never with the model. For frontend, backend and fullstack projects.	plugin manifest, directory listing
README subtitle	Test-ready tickets and tests you can trust, inside Claude Code. One plugin for every team.	README, under the wordmark

Logo

The mark is option A: white code brackets around a light-blue check, on a rounded square that runs from deep blue to blue. It reads as "the code you have, and the tests that prove it", and stays clear down to 32 px.

File	Use
`plugins/quality-code/assets/logo.svg`	the mark, any size
`plugins/quality-code/assets/logo.png`	the mark, 512 × 512 px, the plugin's icon
`docs/brand/wordmark.svg`	mark + name + tagline, for the README and slides
`docs/brand/render_logo.py`	renders the PNG from the same shapes as the SVG

Usage rules:

- Leave clear space around the mark of at least a quarter of its width.
- Do not recolour, stretch, rotate or add shadows or effects.
- On dark backgrounds, use the mark as it is: the square carries its own colour.

Five options were drawn and compared at 96 px and 32 px. A was chosen over B (a Q whose tail is a check), C (a shield), D (a ticket stub) and E (a round, lighter badge): it is the only one that says both "code" and "verified" at every size, and D blurred at favicon size.

Colours

Quality Code uses the TeamSystem palette (Vapor design system), the same as the user guide PDF, so the plugin and its documents look like one product.

Name	Hex	Used for
Deep blue	`#005075`	gradient start, "Code" in the wordmark
Blue	`#0090D1`	gradient end, "Quality" in the wordmark, links, badges
Light blue	`#00C3EA`	the check mark, highlights
Pale blue	`#E5F4FB`	backgrounds, table headers
Ink	`#1F2731`	body text, dark backgrounds
Grey	`#5A6872`	the tagline, secondary text
Rule	`#C9D9E3`	lines and borders

Voice and tone

Quality Code talks like a careful colleague: plain English, short sentences, common words. It says what happened and what to do next, and it never praises a test: the scripts decide, and the words report what they found.

Do	Don't
"This ticket needs a bit more information. We cannot start yet."	"Your ticket failed validation."
"Verdict: ❌ checks failed. What to do: restore the removed assertion or test."	"Great job! Just one small issue to look at."

Do	Don't
"Target: src/pricing.ts (changed on this branch)"	"I think the best file is probably src/pricing.ts."
"Please don't paste tokens here. Revoke that one and set a new one from /plugin."	"Thanks for the token, I'll keep it safe!"
Numbered cards: `1. Continue` / `2. Fix one first`	Open questions with no clear choices

The one exception to plain colour-free text is the risk mark: 🔴 **[RISK / NOT RECOMMENDED]** always appears word for word on a forced run.

Where the brand shows up

The brand is in place in the repository, committed locally and not yet pushed.

Place	What it shows	State
Plugin manifest	display name, long description, icon, homepage, repository, keywords, docs and support links	done
Marketplace	display name, short description, keywords	done
README	wordmark, three badges (tests, Claude Code plugin, Vitest · Playwright), "Quality Code" in the intro	done
Brand page	`docs/brand/BRAND.md`: name rules, logo files, colours, voice	done
User guide PDF	TeamSystem colours, no logo yet	to update
Command cards	voice and the ✅ ⚠️ ❌ 🔴 marks	unchanged

Open questions

- [ ] **TeamSystem brand approval:** may an internal tool use the Vapor palette and a TeamSystem-styled mark, or does the brand team want a sign-off?
- [ ] **License:** the repository has none. MIT, Apache-2.0, or "internal use only"?
- [ ] **Wordmark font:** the wordmark uses the system sans-serif. Should it use a TeamSystem typeface, outlined into the SVG?
- [ ] **User guide PDF:** add the logo to its cover and header.

- [ ] **Repository name:** keep `vissz28/agentic-testing`, or rename it to `quality-code` (install commands would change)?
